Brachypteryx poliogyna. - On

Aug. 1, 1907, an Igorot

brought me a female which  
he had snared on its nest.

He also brought the nest, which  
contained one (1) egg, 24 X 16.5  
General color of egg grayish brown  
ground greenish gray-brown, thickly  
and uniform smear with brown  
obscuring the ground color; great  
end nearly all brown.

Nest outline dry of moss, lined  
with broad grass blades, skeleton  
leaves and fine rootlets.

external diameter 140.

internal " 55

external depth 110

internal " 85

Brachypteryx is one of the  
most elusive birds that I have  
met with. One will dart  
across the trail and alight  
in one of the tangles of brushwood  
and fallen timber that it  
delights to inhabit. The instant  
it alights it hops to a lower  
level where its flitting trail  
appears for an instant like  
the parting twitch of a Prairie  
Dog's tail as it changes end  
and settles as it and disappears into its  
burrrow. One awaits in vain  
its re-appearance; for the  
chances are in favor of its  
being far down the hillside  
inspecting the hollow of some  
decayed stump. Most of my  
specimens have been taken in  
small traps baited for mammals.

Smaller with a touch of satirical.

It is especially usually placed in hollows of decayed trees or among cavities of rocks. It is ~~very~~ clear, its <sup>sweet</sup> high notes shrill & go up and down the scale at dusk, when it is much more apt to appear abroad than during the hours of sun-shine. I have never seen one more than a yard above the ground, on which it runs at an amazing pace.

Oreothraupis. — This bird inhabits the moist nitricate and darksome spots in the alpine forests. It is more easily shot than Brachypteryx, because it does not forsake its haunts when approached, and

because its ~~rough~~ raspy chirp, followed by a low trill is continually heard, as the bird continually moves about the intruder. I have sat for half an hour awaiting an opportunity for a shot, but so nimbly does it run upon the ground and branches of its brushy home that it is as difficult to shoot as a forest mouse. It utters a loud, clear song at rare intervals.

A nest, believed to be of this bird was discovered at a mass of moss ~~4 ft~~ growing upon a tree-trunk about 4 feet above the mossy turf at the apex of Mt. Malindang. This nest was preserved. It was empty.

Prioniturus montanus 7 - The red-crowned Parrot utters a squeaky sound like that of a rusty wheelbarrow. Its cry of oo'-les, is a soft love note which is its Igorote name. It has a variety of harsh notes, the loudest being the notes of alarm when it takes sudden flight. Its flying notes are much softer utterances.
